**G-6-PD, Quant, Blood and RBC**

G-6-PD, Quant	274		U/10E12 RBC	146 - 376	01
Comment:					

Decreased G-6-PD, Quant. values are associated with acute hemolytic anemia when deficient individuals are exposed to oxidative stress, such as with certain medications (e.g., primaquine), infection, or ingestion of fava beans.

Caution: In patients with acute hemolysis (e.g., abnormally low RBC values), testing for G-6-PD may be falsely normal because older erythrocytes with a higher enzyme deficiency have been hemolyzed. Young erythrocytes and reticulocytes have normal or near-normal enzyme activity. Normal values of G-6-PD may be measured for several weeks following a hemolytic event.

Negative <135

Equivocal 135 - 165

Positive >165

A positive result generally indicates exposure to the pathogen or administration of specific immunoglobulins, but it is not indication of active infection or stage of disease.
