G6PD,Qn,Bld and Red Cell Count

| Test | Current Result and Flag | Previous Result and Date | Units | Reference Interval |
|-------------------|-------------------------|--------------------------|-------------|--------------------|
| RBC ⁰² | 4.27 | | x10E6/uL | 3.77-5.28 |
| G-6-PD, Quant | 245 | | U/10E12 RBC | 127-427 |

Comment:⁰¹

When decreased, G-6-PD, Quant. values are associated with acute hemolytic anemia when deficient individuals are exposed to oxidative stress, such as with certain medications (e.g., primaquine), infection, or ingestion of fava beans.

Caution: In patients with acute hemolysis (e.g., abnormally low RBC values), testing for G-6-PD may be falsely normal because older erythrocytes with a higher enzyme deficiency have been hemolyzed. Young erythrocytes and reticulocytes have normal or near-normal enzyme activity. Normal values of G-6-PD may be measured for several weeks following a hemolytic event.

Disclaimer

The Previous Result is listed for the most recent test performed by Labcorp in the past 3 years where there is sufficient patient demographic data to match the result to the patient.
