Test Name	In Range	Out Of Range	Reference Range	Lab
MMR (IGG) PANEL (MEASLES, MUMPS, RUBELLA)				
MEASLES ANTIBODY (IGG)	>5.00		index	EN
Index	Explanation of Test Results			
-----	-----			
< or = 0.90	Negative - No Rubeola (Measles) IgG Antibody detected			
0.91 - 1.09	Equivocal			
> or = 1.10	Positive - Rubeola (Measles) IgG Antibody detected			
Positive results suggest recent or previous infection with Measles (Rubeola) virus and imply immunity. Patients exhibiting equivocal results should be retested in one month, if clinically indicated.				
MUMPS VIRUS	1.40			EN
ANTIBODY (IGG)			index	
Index	Interpretation			
< or = 0.90	Negative			
0.91-1.09	Equivocal			
> or = 1.10	Positive			
A positive result indicates that the patient has antibody to mumps virus. It does not differentiate between an active or past infection. The clinical diagnosis must be interpreted in conjunction with the clinical signs and symptoms of the patient.				
RUBELLA IMMUNE STATUS				EN
RUBELLA ANTIBODY (IGG)	2.40			
Value	Interpretation			
-----	-----			
< or = 0.90	Not consistent with Immunity			
0.91-1.09	Equivocal			
> or = 1.10	Consistent with Immunity			
The presence of rubella IgG antibody suggests immunization or past or current infection with rubella virus.				
HEPATITIS A AB, TOTAL	NON-REACTIVE		NON-REACTIVE	NW
HEPATITIS B SURFACE AB				NW
IMMUNITY, QN	570		> OR = 10 mIU/mL	
Patient has immunity to hepatitis B virus.

Patient Information		Specimen Information	Client Information
DOB:	AGE:	Specimen:	
Gender:		Collected:	
Patient ID:		Received:	
Health ID:		Reported:	

Test Name	In Range	Out Of Range	Reference Range	Lab
< or = 0.90	Negative	-	No VZV IgG Antibody detected	
0.91 - 1.09	Equivocal			
> or = 1.10	Positive	-	VZV IgG Antibody detected	

A positive result indicates that the patient has antibody to VZV but does not differentiate between infection (active or past) and vaccination. The clinical diagnosis must be interpreted in conjunction with the clinical signs and symptoms of the patient. This assay reliably measures immunity due to previous infection but may not always be sensitive enough to detect antibodies induced by vaccination. Thus, a negative result in a vaccinated individual does not necessarily indicate susceptibility to VZV infection.
