0.90-1.09	Equivocal
>1.09	Positive

This assay utilizes recombinant type-specific antigens to differentiate HSV-1 from HSV-2 infections. A positive result cannot distinguish between recent and past infection. If recent HSV infection is suspected but the results are negative or equivocal, the assay should be repeated in 4-6 weeks. The performance characteristics of the assay have not been established for pediatric populations, immunocompromised patients, or neonatal screening.

CASCADING REFLEX

T. PALLIDUM AB	NEGATIVE	
----------------	----------	--

Reference range: Negative

No antibodies to T. pallidum (the agent causing syphilis) were detected in the specimen. This result, however, does not exclude very recent T. pallidum infection; testing of a second specimen, collected 2-4 weeks after this specimen, is recommended if the index of suspicion for recent infection is high.

HCV antibody was non-reactive. There is no laboratory evidence of HCV infection. In most cases, no further action is required. However, if recent HCV exposure is suspected, a test for HCV RNA (test code 35645) is suggested.
